

Homework One

This was my first experience in working as a group rather than working individually. We met at the library and divided our group into mainly two parts. One of them was responsible for writing the class and the other was responsible for writing the main. We worked mostly as a team. We shared our ideas all the time. I think the most challenging part was the "tryThis" method. After we figured out how to build the algorithm, the rest of the code was more simple. However we had some struggles with "Stringbuffer". After we tested our code for the first time there were some errors. The append method was not changing the stringbuffer but it was adding a new string to its end. We searched as a group and found a solution. I believe it was beneficial to work as a team. I learned some new ways, methods that I did not know about before. After we finished our parts. There was a mistake. If we enter the same letter again, the program should give a warning however our code did not give the warning. After I fixed the code individually. We added some game modes to our code. Working with a team was mostly beneficial, our communication was good, exchanging our information was advantageous in many ways. I believe if we continue in the same way, it will be very functional.
